PHYS 100C, Midterm exam. Wed., May 5th 10:00AM-10:50AM

 a) From energy conservation considerations, find the power-law scaling dependence of time-average E and B fields of a spherically symmetrical wave in vacuum, on a distance R from the source.

Energy flux
$$\vec{S} = \vec{E} \times \vec{B} \sim \frac{1}{R^2}$$
 (Since
since $|\vec{B}| = |\vec{E}|$, $|\vec{E}| |\vec{B}| \sim \frac{1}{R}$

b) Write a general expression for E (x,y,z,t) and B (x,y,z,t) of a planar monochromatic wave with wavelength λ and amplitude E₀ polarized along (0, 1, 1) direction in y-z plane and propagating (in vacuum) along x direction.

$$E = \frac{E_{o}}{\Gamma_{2}} \left(\hat{\gamma} + \hat{z} \right) \cdot \cos \left(\frac{2\pi x}{\lambda} - \frac{2\pi c}{\lambda} + \varphi \right)$$
$$B = \frac{E_{o}}{c \sqrt{2}} \left(\hat{z} - \hat{\gamma} \right) \cdot \cos \left(\frac{2\pi x}{\lambda} - \frac{2\pi c}{\lambda} + \varphi \right)$$

2. a) For shallow gravity water waves group velocity is

$$v_{group} = \sqrt{\frac{g\lambda}{2\pi}}$$

where λ is wavelength and g is a gravitational field strength. Find the ratio of phase and group velocities, $\frac{v_{phase}}{v_{group}}$.

b) Do the same for capillary waves, for which

$$v_{group} = \sqrt{\frac{2\pi\sigma}{\rho\lambda}}$$

where σ is the surface tension and ρ is the liquid density (both are constants, naturally).

- 3. Rectangular waveguide has dimensions a=0.25 mm and b=0.20 mm.
 - a) List <u>all TE_{mn} modes excited by EM wave with wavelength λ =0.21 mm.</u>
 - b) What range of wavelengths will excite three and only three modes?

(Hint: if you are clever enough, you will not need the value for speed of light, c, in these calculations)

Allowed modes TEmn

$$\begin{array}{c|c} (m)^{2} + (\frac{h}{b})^{2} < (\frac{2}{\lambda})^{2} & \frac{2}{b} = 9.52 \text{ mm}^{-1} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{2}{\lambda})^{2} & \frac{1}{b} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{2}{\lambda})^{2} & \text{mm}^{-1} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{2}{\lambda})^{2} & \text{mm}^{-1} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{2}{\lambda})^{2} & \text{mm}^{-1} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{h}{b})^{2} & \text{mm}^{-1} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{h}{b})^{2} & \text{mm}^{-1} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{h}{b})^{2} & \text{mm}^{-1} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{h}{b})^{2} & \text{mm}^{-1} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{h}{b})^{2} & \text{mm}^{-1} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} < (\frac{h}{b})^{2} & \text{mm}^{-1} & A \text{ wswer} \\ \hline m & h & (\frac{h}{b})^{2} & \text{ws} & TE_{10} & TE_{11} & TE_{11} \\ \hline m & 1 & 6.4 & \text{yrs} & B \text{ std} \text{ lowest mode} \\ \hline m & 1 & 6.4 & \text{yrs} & B \text{ std} \text{ lowest mode} \\ \hline m & 2 & 10 & \text{ws} & 6.4 \text{ mm}^{-1} & C \text{ mm}^{-1} \\ \hline m & 2 & 10 & \text{ws} & 6.4 \text{ mm}^{-1} & C \text{ stm}^{-1} \\ \hline m & 3 & 0 & 12 & \text{ws} & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} & C \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} & C \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} & A \text{ stm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1} \\ \hline m & 0.25 \text{ mm}^{-1}$$
